Introducing the
Zyla 4.2 PLUS
- 82% QE_{max}
- 99.8% linearity
- 53 fps (USB 3.0)
- 100 fps (Camera Link)
Scientific CMOS (sCMOS) technology overview

Scientific CMOS (sCMOS) is a breakthrough technology that offers an advanced set of performance features that render it ideal to high fidelity, quantitative scientific measurement. Scientific CMOS can be considered unique in its ability to simultaneously deliver on many key performance parameters, overcoming the ‘mutual exclusivity’ associated with current scientific imaging technology standards, and eradicates the performance drawbacks traditionally associated with CMOS imagers.

sCMOS is uniquely capable of simultaneously delivering:
- Extremely low noise
- Rapid frame rates
- Wide dynamic range
- High resolution
- Large field of view
- High Quantum Efficiency (QE)
- Rolling and Global (Snapshot) exposure modes

Neo cameras will literally allow one to see cells in a new light with ultra sensitive imaging at speeds never achieved before - as we have seen in our tests of vesicle trafficking. These scientific CMOS cameras are not a small step, but a quantum leap, that will open up new possibilities of what can be studied in fast cellular processes, rapid screening, and super-resolution imaging.

sCMOS - Imaging without compromise

The multi-megapixel sensors offer a large field of view and high resolution, without compromising read noise, dynamic range or frame rate. Rolling and Global (Snapshot) shutter readout ensure maximum application flexibility.

Read noise is exceptional, even when compared to the highest performance “slow-scan” CCDs. The fact that an sCMOS device can achieve 1 electron rms read noise while reading out up to 5.5 megapixels at 100 fps through the 10-tap cameraLink interface, or 40 fps through the USB 3.0 interface renders it truly extraordinary in the market. By way of comparison, the lowest noise Interline CCD, reading out only 1.4 megapixels at ~16 fps would do so with ~10 electrons read noise.

The low noise readout is complemented by up to 33,000:1 dynamic range. Usually, for CCDs or EMCCDs to reach their highest dynamic range values, there needs to be a significant compromise in readout speed, yet sCMOS can achieve this value while delivering high frame rates. The unique dual amplifier architecture of sCMOS allows for high dynamic range by offering a large well depth, despite the relatively small 6.5 µm pixel size, alongside lowest noise. A 1.4 megapixel Interline CCD with similarly small pixels achieves only ~1,800:1 dynamic range at 16 fps.

Derek Toomre, PhD., Associate Professor, Department of Cell Biology, Yale University School of Medicine, USA

Parameter | sCMOS (Zyla 4.2 PLUS) | Interline CCD | EMCCD
---|---|---|---
Sensor Format | 5.2 megapixel | 1.4 to 4 megapixel | 0.25 to 1 megapixel
Pixel Size | 6.5 µm | 6.45 to 7.4 µm | 8 to 16 µm
Read Noise | 0.9 e- @ 30 fps | 1.1 e- @ 100 fps | < 1e- (with EM gain)
Frame Rate (max.) | Sustained: 100 fps full frame | 3 to 16 fps | ~30 fps
Quantum Efficiency (max.) | 82% | 80% | 90% "back-illuminated"
Dynamic Range | 33,000:1 (@ 30 fps) | -3,000:1 (@ 11 fps) | 8,500:1 (@ 30 fps, with low EM gain)
Multiplicative Noise | None | None | 1.41x with EM gain

See page 40 for "Comparing sCMOS with other detectors" technical note.
Andor’s Neo sCMOS vacuum cooled camera platform has been engineered from the ground up, specifically to realize the absolute highest sensitivity from this exciting new sensor technology.

Neo 5.5 offers an exceptionally low dark current and read noise floor detection limit, maintained even under longer acquisition times, alongside a wide dynamic range of 30,000:1. Speeds of 30 fps (full frame) can be maintained over extended kinetic series acquisitions, with 100 fps achievable in burst mode.

Neo 5.5 offers an advanced set of unique performance features and innovations, including deep vacuum TE cooling to -40°C, extensive 'on-head' FPGA data processing capability, a 4 GB memory buffer and a Data Flow Monitor. Andor’s UltraVac™ vacuum process has been implemented to offer not only the necessary deep cooling capability, but also complete protection of the sensor. These capabilities have been conceptualized to drive the best possible performance, image quality and longevity from sCMOS technology.

Neo 5.5 offers both Rolling and true Global (also known as ‘Snapshot’) shutter exposure mechanisms. Snapshot mode provides an exposure sequence that is analogous to that of an Interline CCD, whereby all pixels begin the exposure simultaneously and end the exposure simultaneously.

### Key Features

- **-40°C vacuum cooling**
- **Rolling and true Global shutter modes**
- **Vacuum longevity**
- **Blemish minimization**
- **4 GB on-head image buffer**
- **5.5 μm pixels**
- **1 e- noise**

### Features and Benefits

- **TE cooling to -40°C**: Minimization of dark current to maintain low noise advantage under all exposure conditions.
- **Rolling and true Global (Snapshot) shutter**: Minimization of hot pixel blemishes meaning more useful pixels. Fan-off mode for vibration sensitive set-ups.
- **6.5 μm pixel size**: Maximum exposure and readout flexibility across all applications. Snapshot for 'Interline CCD' exposure capability.
- **1 e- read noise**: Offers lower detection limit than any CCD.
- **5.5 megapixel sensor format and 6.5 μm pixels**: Delivers extremely sharp resolution over a 22 mm diagonal field of view; ideal for cell microscopy, digital pathology, high content screening and astronomy.
- **Dark Noise Suppression (DNS) technology**: Extremely competitive low dark current of 0.14 e/pix/sec with fan cooling. Maintains low noise advantage across range of exposure conditions.
- **Rapid frame rates**: 30 fps over extended kinetic series. Burst to memory at 100 fps full frame.
- **UltraVac™**: Sustained vacuum integrity and unequalled cooling with 5 year warranty; complete sensor protection.
- **Dual-Gain amplifiers**: Maximum well depth and lowest noise simultaneously, affording extended dynamic range of 30,000:1.
- **GPU Express**: Simplify and optimize data transfers from camera to Graphical Processing Unit (GPU) card to facilitate accelerated GPU processing as part of the acquisition pipeline.
- **4 GB on-head image buffer**: Enables bursts of 100 fps full dynamic range. Capture extended kinetic series faster than PC write speed, avoiding prohibitively expensive PCs.
- **Sub-microsecond inter-frame gap**: Global Shutter offers down to 100 ns inter-frame gap, ideal for PIV applications.
- **Extensive FPGA on-head data processing**: Essential to ensure best image quality and quantitative fidelity from sCMOS technology.
- **Hardware timestamp**: FPGA generated timestamp with 25 ns accuracy.
- **Dynamic baseline clamp**: Essential to ensure quantitative accuracy on images and between successive images of a kinetic series.
- **Spurious noise filter**: Realtime FPGA filter that identifies and compensates for spurious high noise pixels.
- **Data Flow Monitor**: Innovatively manage acquisition capture rates vs data bandwidth limitations.
- **Comprehensive trigger modes and I/O**: Communication and synchronization within intricate experimental set-ups.

### Key Specifications

- **Active Pixels**: 2660 x 2160
- **Pixel Size (μm)**: 6.5 x 6.5
- **Sensor (mm)**: 16.6 x 14
- **Read Noise (median, e-)**: 1 @ 200 MHz
- **Sensor Cooling**: -40°C
- **Sensor Well Depth (e-)**: 30,000
- **Max Readout Rate (MHz)**: 560 MHz
- **Max Frame Rates (fps)**: 30 fps full frame
- **QE max**: 60%

### Neo 5.5 QE curve

![Neo 5.5 QE curve](image.png)
Andor's Zyla 5.5 sCMOS camera offers high speed, high sensitivity imaging in a remarkably light and compact design. Both Rolling and true Global shutter modes offer extensive application flexibility. Global shutter is ideally suited to fast multi-dimensional microscopy, offering tight synchronization to 'moving' peripheral devices such as z-stage or light source.

Zyla is ideally suited to many cutting edge applications that push the boundaries of speed, offering sustained frame rate performance of up to 100 fps (faster with ROI). A highly cost-effective USB 3.0 version is also available, offering an unparalleled 40 fps (full frame) and 1.2 e- rms read noise, representing an ideal low light 'workhorse' camera solution for both microscopy and physical science applications, in either research or OEM environments.

Rolling and Global (Snapshot) shutter readout ensures maximum application flexibility. Global shutter in particular provides an important 'freeze frame' exposure mechanism that emulates that of an Interline CCD, overcoming the transient readout nature of Rolling shutter mode.

‘Conceptualized to dramatically outperform Interline CCD technology within a ‘mid-range’ price bracket, Andor’s Zyla 5.5 sCMOS is ideally placed to become the new gold standard workhorse imaging detector.’

Zyla 5.5 sCMOS for OEM

The light and compact form factor coupled with design and mounting adaptability, board level or private labeling options, and unparalleled engineering support, renders the Zyla highly suited to OEM integration. Please call Andor to discuss how Zyla can be made to work for you.

Baseline Clamp

Essential to ensure quantitative accuracy across the image area and between successive images of a kinetic series.

Spurious Noise Filter

Real time FPGA filter that identifies and compensates for spurious high noise pixels.

FE cooling to 0°C in 35°C ambient

Ideal for OEM integration into enclosed systems.

GPU Express

Simplify and optimize data transfers from camera to Graphical Processing Unit (GPU) card to facilitate accelerated GPU processing as part of the acquisition pipeline.

Dual-gain amplifiers

Maximum well depth and lowest noise simultaneously, affording extended dynamic range of 25,000:1.

Temperature suppression

Extremely competitive low dark current of 0.14 e-/pix/sec with fan cooling. Maintains low noise advantage across range of exposure conditions.

Sub-microsecond inter-frame gap

Global Shutter offers down to 100 ns inter-frame gap, ideal for PIV applications.

Sub-microsecond inter-frame gap

Global Shutter offers down to 100 ns inter-frame gap, ideal for PIV applications.

Extensive FPGA on-head data processing

Essential to ensure best image quality and quantitative fidelity from sCMOS technology.

Hardware timestamp

FPGA generated timestamp with 25 ns accuracy.

Dynamic baseline clamp

Essential to ensure quantitative accuracy across the image area and between successive images of a kinetic series.

Spurious noise filter

Real time FPGA filter that identifies and compensates for spurious high noise pixels.

Zyla QE curve

NEW

NEW

Features and Benefits

Compact and light

Highest QE sCMOS sensor, providing optimal signal to noise in low light applications.

Rolling and true Global (Snapshot) shutter

Maximum exposure and readout flexibility across all applications. Snapshot for 'Interline CCD mode' freeze frame capture of fast moving changing events.

Industry fastest frame rates

100 fps sustained via Camera Link (full frame). Industry fastest USB 3.0 frame rates.

FCS Mode

Offers a market-leading speed of 27,067 fps from a 2560 x 860 region of interest, ideally matched to the temporal demands associated with Fluorescence Correlation Spectroscopy

3.5 megapixel sensor format and 6.5 μm pixels

Delivers extremely sharp resolution over a 22 mm diagonal field of view. Ideal for cell microscopy, digital pathology, high content screening and astronomy.

Dual-gain amplifiers

Maximum well depth and lowest noise simultaneously, affording extended dynamic range of 25,000:1.

12-bit and 16-bit modes

12-bit for smaller file size and absolute fastest frame rates through USB 3.0; 16-bit for full dynamic range.

Sub-microsecond inter-frame gap

Global Shutter offers down to 100 ns inter-frame gap, ideal for PIV applications.

Spurious noise filter

Real time FPGA filter that identifies and compensates for spurious high noise pixels.

Zyla 4.2 PLUS is the latest sCMOS technology advancement from Andor. Offering the highest and broadest sCMOS QE profile available, maximizing at 82%, and ideally suited to a wide range of common fluorophores. The Zyla 4.2 PLUS is also uniquely speed-optimized to deliver a sustained 53 fps at full resolution through a convenient USB 3.0 interface, 77% faster than competing sCMOS cameras. New on-camera intelligence delivers a significant linearity improvement, providing unparalleled quantitative measurement accuracy across the full dynamic range. The high resolution 4.2 megapixel camera delivers QE performance that is 10% higher than the previous gold-standard sCMOS sensor, coupled with <1 e- read noise and 33,000:1 dynamic range in a light, compact, low vibration design, intended for both research and OEM usage. The Zyla 4.2 PLUS also includes application specific capability, such as FCS Mode. FCS Mode offers a market-leading speed of 26,041 fps from a 2048(h) x 8(v) region of interest, ideally matched to the temporal demands associated with Fluorescence Correlation Spectroscopy.

**NEW**

GPU Express facilitates real time data processing. The Zyla 4.2 PLUS differs fundamentally from Zyla 5.5 in terms of shutter flexibility. Whereas Zyla 5.5 offers both Rolling and true Global shutter modes, the Zyla 4.2 PLUS operates in Rolling shutter mode. However, a mechanism called ‘Simulated Global Exposure’ is available, whereby a TTL output from the camera can simulate a true Global shutter mode. Nonetheless, a mechanism called ‘Rolling shutter and simulated Global Exposure mode’ is available, whereby a TTL output from the camera can simulate a true Global shutter mode. The Andor Zyla provides an impressive combination of field-of-view, sensitivity, resolution and speed. It is a highly versatile camera that can be used for many different applications.

### Key Features

- **≥ 80% QE**
- **< 1 e- read noise**
- Dark Noise Suppression Technology
- **100 fps sustained**
- Market leading USB 3.0 speed
- **4.2 megapixel**
- **LightScan PLUS**

### Key Specifications

- **Active Pixels**: 2684 x 2048
- **Pixel Size (μm, μm)**: 6.5 x 6.5
- **Sensor size (mm)**: 13.3 x 13.3
- **Read Noise (median, e-)**: 0.9 @ 216 MHz
- **Sensor Cooling**: 5°C (up to +27°C ambient)
- **Pixel Well Depth (e-)**: 30,000
- **Max Readout Rate (MHz)**: 540 MHz
- **Max Frame Rates (fps)**: Camera Link: 100
- **USB 3.0: 53
- **QE max**: 82%
Zyla - The Biologist's Choice

Zyla sCMOS has proven a superb camera choice for the biologist and microscopist. Many simply see the Zyla as an amazing value, superb price/performance ‘workhorse’ camera with which to replace their existing Interline CCD and upgrade the performance of their fluorescence microscope. Others are driven by distinct application performance criteria that only sCMOS can answer.

Quality, Throughput, Performance, Accessibility...

- High Sensitivity and Wide Dynamic Range – quantify very weak and very bright structures with one image.
- Superb Image Quality – high resolution and uniform backgrounds for publication-quality imaging.
- Capture Everything – the larger field of view matches that of modern microscopes. Achieve better statistics and higher throughput in high content experiments.
- Blazingly Fast – more and more studies of cell processes require greater temporal resolution. GPU Express for real time data processing.
- Ease of use – designed to get you up and imaging with minimal fuss.
- Flexible – fast or slow, big or small, weak or bright ... Zyla is adaptable all of your imaging challenges.

Example Areas of Application

- **Lightsheet Microscopy**
  - Zyla sCMOS yields markedly improved throughput and statistical validity of data in high content analysis. For example, a larger field of view results in analysis of more cells per image; wider dynamic range means a field of variable intensity cells can be quantified in only one acquisition; and higher sensitivity results in reduced acquisition times. GPU Express for real time data processing.

- **Super Resolution Microscopy**
  - The true Global Shutter mode of Zyla 5.5 facilitates an inter-frame gap of down to 100 ns.

- **Physiology / Ion Imaging**
  - The fast frame rate and excellent sensitivity of Zyla is ideally suited to the particular needs of ion signalling microscopy. Zyla 4.2 PLUS offers superlative sensitivity at speed, but electrophysiology may require the Global shutter exposure mode of Zyla 5.5 to ensure temporal correlation across the whole image.

- **Cell Motility**
  - The motile cell is captured extremely well by the speed and resolution of the Zyla. Generally, the Rolling shutter of Zyla 4.2 PLUS is suitable, but care must be taken of distortive effects if the cell is moving particularly fast. For example, it has been noted that the Zyla 5.5 in Global shutter mode was required to image mobile sperm cells.

- **Other biological applications include:**
  - Neuroscience, Vesicle Transport, Parasitology, Blood Flow, Ophthalmology

Zyla - The Physicist’s Choice

Zyla sCMOS has become a well established detector amongst physicists, biophysicists and astronomers; the advanced combination of speed, sensitivity and dynamic range enabling new ground to be broken.

Performance and Adaptability

- **Dual Amplifier** – novel pixel architecture means you don’t need to pre-select gain. Access lowest read noise and full well depth simultaneously.
- **1000 fps** – access extremely fast frame rates through user definable Region of Interest control, suited to many applications within the physical sciences. GPU Express for real time data processing.
- **Global shutter – Zyla 5.5** offers this important mode that completely avoids spatial distortion, and ensures temporal correlation across all regions of the sensor. Sub-microsecond inter-frame gap, ideal for PW applications.
- **Low dark current** – low read noise is complemented by extremely competitive dark current, also ensuring minimized hot pixel blemishes.
- **Cooling options** – standard camera air cools to 0°C up to +35°C ambient. Water cooled option available on request.
- **Blemish correction maps and advanced control** – upon request, Andor provides bespoke capability to turn on blemish correction, for those who prefer to perform this themselves. Blemish maps can be provided.
- **Compact and Light** – the extremely small volume footprint of Zyla renders it adaptable to intricate optical set-ups.

Example Areas of Application

- **Particle Imaging Velocimetry (PIV)**
  - The true Global Shutter mode of Zyla 5.5 facilitates an inter-frame gap of down to 100 ns.

- **Fluorescence Correlation Spectroscopy**
  - The FCS mode, now available on Zyla 4.2 PLUS provides market leading speeds of 25-41 frames per second (fps) on x8(y) region of interest, ideally matched to the temporal demands associated with Fluorescence Correlation Spectroscopy.

- **X-Ray / Neutron Tomography**
  - The Zyla can be readily lens coupled to scintillators and phasemaps, presenting a high resolution, sensitive and fast solution for tomography.*

* Zyla HF

Check out Andor’s new Zyla HF Fiber Optic coupled camera, superb for fast indirect X-Ray applications such as tomography or non-destructive testing.
Upgrade Your Microscope’s Performance

**Zyla sCMOS - Disruptive Technology, Familiar Price**

**What was the benchmark imaging detector?**

Interline CCD technology has been the dominant ‘workhorse’ detector type for fluorescence cell microscopy for almost 15 years, the benchmark sensor being a 1.4 megapixel, 6.45 µm pixel size device, offering typical read noise floor between 5 and 8 e- rms at modest frame rates of 11-12 fps.

**Upgrade your microscope using the imaging superiority of Zyla sCMOS:**

Fundamentally, sCMOS technology has been conceptualized as a vastly superior alternative to Interline CCDs. Indeed, Andor’s Zyla sCMOS offers dramatically higher performance, yet remains within the same price bracket as Interline cameras, and is ideally placed to become the new gold standard ‘workhorse’ laboratory detector. Importantly, Zyla uniquely comes with both Rolling and true Global (Snapshot) shutter.

In particular, Global shutter offers a simple Snapshot imaging capability, directly analogous to that of Interline CCDs, offering zero image distortion and perfect for synchronizing to peripheral devices.

The table below compares some typical performance specifications of a 1.4MP Interline CCD to those of the new Zyla sCMOS, outlining the approximate factor improvement that is available.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Typical Interline CCD Specifications</th>
<th>Zyla 5.5 sCMOS Specifications</th>

</tbody>
</table>

* Frame rates provided are for the 10-tap Cameralink model. An even more affordable USB 3.0 model is available, in the case of the Zyla 5.5 offering 40 fps sustained at full 5.5 megapixel resolution.

**Why is Zyla such an impressive all-round imager?**

- **Superior performance** – vastly superior to Interline across key performance parameters.
- **Rolling and Global exposures (Zyla 5.5)** – Zyla is unique in offering both these exposure modes in one camera. Global shutter (Snapshot) is directly analogous to the Interline exposure mechanism.
- **Image quality** – a huge amount of effort and on-camera (FPGA) intelligence has gone into optimizing image quality in Zyla.
- **Flexibility** – fast, slow, weak, bright, pixel binned, region of interest, Rolling shutter, Snapshot shutter... Zyla is adaptable to a broad gamut of application requirements.
- **Affordable price** – with so many superb features, we have endeavoured to make the Zyla accessible to every lab. Request a quote, you’ll be pleasantly surprised!
- **USB 3.0** - ‘Plug and play’ interface with industry fastest frame rates.

**Key Biological Applications**

- Live cell imaging
- Widefield fluorescence microscopy
- Developmental biology
- Embryo studies
- Physiology / Ion Imaging
- Neuroscience / Vesicle Transport
- Parasitology
- Cell Motility

**Benefits of Upgrading**

- 5x more sensitive
- 4x larger field of view
- 5x more pixels
- 10X more dynamic range
- 16X faster

**5.5 MP sCMOS**

**1.4 MP CCD**

**sCMOS**

**CCD**
Performance and Innovations

Extended Dynamic Range

The Andor Neo and Zyla cameras are designed to make use of the innovative dual ‘column-level’ amplifier design of the sensors.

Traditionally, sensors require that the user must select up-front between high or low amplifier gain (i.e. sensitivity) settings, depending on whether they want to optimize for low noise or maximum well depth. The dual amplifier architecture of the sCMOS sensor circumvents this need, in that signal can be sampled simultaneously by both high and low gain amplifiers. As such, the lowest noise of the chip can be harnessed alongside the maximum well depth, affording widest possible dynamic range of up to 33,000:1.

Dual Amplifier Architecture:
Each column within each half of the sensor is equipped with dual column level amplifiers and dual analog-to-digital converters (ADC).

This architecture was designed to simultaneously minimize read noise and maximize dynamic range. The dual column level amplifiers/ADC pairs have independent gain settings, and the final image is reconstructed by combining pixel readings from both the high gain and low gain readout channels to achieve an unprecedented intra-scene dynamic range from the relatively small 6.5 µm pixel pitch.

Lowest Noise Floor

Andor’s ultra sensitive sCMOS cameras have broken new ground in offering down to 0.9 electron rms read noise, without signal amplification technology.

What is truly extraordinary is that this performance level is achievable at 30 fps, representing 200 MHz pixel readout speed. Furthermore, even at full readout speed, the read noise floor is negligibly compromised, maintaining down to 1.3 e- rms at 100 fps. For the best CCD cameras to even approach 2 electrons noise, a readout speed of 1 MHz or slower is required. This minimal detection limit renders Andor’s sCMOS cameras suitable for a wide variety of challenging low light imaging applications.

Comparative low light images taken with Neo sCMOS (1.3 electrons read noise @ 560 MHz) vs. Interline CCD (5 electrons read noise @ 20 MHz), displayed with same relative intensity scaling.

(a) LED signal in a light-tight imaging enclosure, intensity ~30 photons/pixel;
(b) Fluorescently labelled fixed cell using a CSU-X spinning disk confocal microscope (x60 oil objective), each 100 ms exposure, same laser power.

Zyla uniquely offers both 12-bit and 16-bit modes. 12-bit for smaller file size and absolute fastest frame rates through USB 3.0; 16-bit for full dynamic range.
Performance and Innovations

Rapid Frame Rates

The parallel readout nature of sCMOS means it is capable of reaching very rapid frame rates of up to 100 full frames per second, and much faster with region of interest.

Distinctively, this is accomplished without significantly sacrificing read noise performance, markedly distinguishing the technology from CCDs. Andor’s sCMOS cameras are uniquely designed to harness this speed potential.

Data Flow Monitor

The sCMOS sensor in Neo and Zyla is capable of extremely fast data read rates, but this in itself imposes considerable challenges.

For sustained kinetic series measurements it is possible to be rate limited by:

(a) bandwidth of the Camera Link interface connecting the camera to the PC
(b) hard drive write speed

In such circumstances the true frame rate threshold also depends on many set-up factors, including exposure time, ROI size, binning, pixel readout rate and choice of single or dual amplifier data.

The Data Flow Monitor, available through Andor Solis acquisition and analysis software, has been innovated to provide a simple visual tool that enables you to instantly ascertain if your acquisition parameters will result in a rate of data transfer that is too fast for either interface or hard drive.

It will also determine if the kinetic series size is within the capacity of camera memory, hard drive space or PC RAM.

Maximum frame rates achievable from the Zyla 5.5 and Zyla 4.2 PLUS sCMOS USB 3.0 and 10-tap Camera Link versions 12-bit (16-bit)
Performance and Innovations

Deep Thermoelectric Cooling

Andor’s Neo offers the deepest sensor cooling available from any CMOS imaging camera on the market, minimizing both dark current and hot pixel blemishes. Additionally, through the use of water cooling, the fan can be switched off in the software to minimize camera vibration; ideal for set-ups that are particularly vibration sensitive.

Deep TE cooling is useful for a number of reasons:

Minimization of dark current

sCMOS cannot be considered a truly flexible, workhorse camera unless dark current contribution has been minimized. Deep cooling means the low noise advantage can be maintained under all exposure conditions.

Minimization of hot pixel blemishes

Hot pixels are spurious pixels with significantly higher dark current than the average and can be problematic even under relatively short exposure times. Cooling has a major influence in minimizing the occurrence of such events, offering both an aesthetically cleaner image and a greater number of unfiltered, usable pixels.

Minimization of vibration

Many optical configurations are sensitive to vibrations from the camera fan.

Andor’s Neo offers:

(a) Two fan speeds

(b) The ability to turn off the fan, either temporarily or permanently if flowing liquid through the camera (the latter also allows the Neo to be stabilized at -40ºC)

5 Year Vacuum Warranty

Our faith in the unique sCMOS vacuum process used in Neo means that we are proud to offer an extensive 5 year warranty on the vacuum enclosure.

UltraVac™ (Neo only)

The Andor Neo is the only vacuum housed CMOS sensor available on the market, offering superior quality, performance and longevity.

Andor’s proprietary UltraVac™ process has a proven track record of field reliability, accumulated over more than 16 years of shipping high-end vacuum cameras. Using a proprietary technique, we have adapted these processes for use with the additional connections associated with the sCMOS sensor.

- Permanent hermetic vacuum seal
- Sustained deep TE cooling
- No maintenance / re-pumping
- No risk of condensation
- Minimize out-gassing

Thermometric Precision

The temperature sensor in the Neo and Zyla sCMOS cameras measures with a thermostatic precision of 0.05ºC

<table>
<thead>
<tr>
<th>Neo Cooling Temperature</th>
<th>Dark current (e-/pix/sec)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-30ºC (fan cooling)</td>
<td>0.015</td>

</tr>
</tbody>
</table>

sCMOS @ -40ºC

Thermal noise can sacrifice the sCMOS low detection limit. Low light images recorded with a Neo sCMOS camera at +5ºC and -40ºC sensor cooling temperatures; 50 sec exposure time; 200 MHz readout giving 1 electron read noise.

Exposure time: 1 s

Hot pixel blemishes are significantly reduced at deeper cooling temperatures, requiring much reduced pixel correction. Uncorrected images are shown above for 1 sec exposure.

Schematic of the Neo sCMOS permanent vacuum head

UltraVac™ (Neo only)
Performance and Innovations

Advanced FPGA on-head processing

Andor’s Neo and Zyla cameras are each equipped with considerable FPGA processing power. This is essential in order to dynamically normalize data at the pixel level for minor variations in bias offset, thus eradicating fixed pattern noise associated with this CMOS phenomenon. This superior dynamic processing capability is also utilized to optionally filter the small percentage of spurious noise pixels from the image.

Pixel-level bias offset compensation

The advanced processing power and memory capacity permits implementation of bias offset compensation for every pixel in the array. This ultimately relates to a lower noise background.

Dynamic baseline clamp

A real time algorithm that uses dark reference pixels on each row to stabilize the baseline (bias) offset. Necessary to ensure quantitative accuracy across each image and between successive images.

Spurious noise filter

An optional real time filter that identifies and compensates for ‘spurious’ high noise pixels that are greater than 5 electrons (< 1% of all pixels).

Andor offer the capability to switch off interpolative pixel filtering and provision of custom blemish maps, important for applications such as super-resolution microscopy or astronomy.

Large Field of View

The multi-megapixel sensors present in the Neo and Zyla offer an extended field of view, markedly exceeding the FOV available from alternative Interline CCD devices.

Flexibility is key however, and if a large FOV is not required for a particular application, Neo and Zyla offer a range of pre-selected ROI sizes at the click of a button, as well as user defined (with single pixel granularity).

- 21.8 mm diagonal (Zyla 5.5 and Neo 5.5); 18.8 mm diagonal (Zyla 4.2 PLUS)
- Closely matched to modern microscopes
- Pre-selected ROIs to quickly opt for smaller FOV if required
- x 3.5 larger than popular 512 x 512 EMCCD sensor
- x 3.9 larger than popular 1.4 MP Interline CCD sensor
- Combine large FOV with dual wavelength image splitter (OptoSplit)

6.5 μm pixel size combined with 30,000 electron well depth

The 6.5 μm pixel present in Neo and Zyla has been specifically designed to offer an optimal balance of optical resolution, photon collection area and well depth. This pixel size has been determined to provide ideal over-sampling of the diffraction limit in typical cell microscopy with x 60 and x 100 objectives.

- Ideal balance of resolution, photon collection and well depth
- Superb 30,000 electron well depth
- No pixel binning required = no doubling of read noise
- No demagnification optics = no wasteful photon loss
Performance and Innovations

Rolling and Global (Snapshot) Shutter Modes

Neo 5.5 and Zyla 5.5 are distinct in offering both Rolling shutter and true Global shutter modes from the same sensor, such that the most appropriate mode can be selected dependent on application requirements.

Uniquely benefit from a choice...

The 5.5 megapixel sCMOS sensor that is in Zyla 5.5 and Neo 5.5 sCMOS cameras uniquely offers both Rolling and Global exposure modes. This provides superior application and synchronization flexibility and the ability, through Global exposure, to closely emulate the familiar ‘Snapshot’ exposure mechanism of Interline CCDs.

Rolling and Global Shutter Mechanisms

Rolling and true Global shutter modes describe two distinct types of exposure and readout sequence.

In Rolling shutter, available in all Andor sCMOS cameras, different lines of the array are exposed at different times as the read out ‘wave’ sweeps through the sensor. 10 ms are required at the start to ‘activate’ the sensor to expose, and then 10 ms are required at the end to readout the sensor. Use when not synchronizing to peripheral devices and only when there is a minimal risk of spatial distortion from slow moving sample.

In true Global shutter, offered in both Neo 5.5 and Zyla 5.5 models, each pixel in the sensor begins the exposure simultaneously and ends the exposure simultaneously. This provides a true ‘Snapshot’ exposure capability for moving samples that is both photon-efficient and easy to synchronize to, especially useful for 3D / 4D microscopy. Zyla 4.2 PLUS, while utilizing a Rolling shutter sensor, offers a Simulated Global Exposure mechanism to overcome risk of spatial distortion. True Global Shutter is also essential for applications such as Particle Imaging Velocimetry (PIV), where sub-microsecond inter-frame gaps are required.

Global Exposure is Distortion Free

If light is falling on the sensor during the ‘transient’ phases (first 10 ms and final 10 ms) of the Rolling shutter exposure mechanism, and an object is moving during this time, then there is a chance of some degree of spatial distortion. The degree of distortion is dictated by the relative size, direction and speed of the object. Global shutter avoids spatial distortion since there are no ‘transient’ exposure phases.

These images show the head of a moving sperm cell, imaged by the Neo sCMOS in both Global and Rolling shutter. Distortion of the shape of the sperm head is evident in Rolling shutter.

Key Benefits of true Global shutter (Zyla 5.5 and Neo 5.5)

Global shutter in particular is viewed as an important mode for the biologist, as its benefits are deeply synergistic with the core imaging requirements of live cell microscopy.

• No spatial distortion – avoiding the spatial distortion risk of Rolling exposure
• 3D / 4D microscopy - recommended for syncing to peripheral switching devices
• Higher signal to noise due to reduced dead time offering higher ‘effective’ QE
• Simplicity – all the benefits of an ‘Interline exposure mode’
• Compatible with continuous or pulsed light sources
• Sub-microsecond inter-frame gap, ideal for PIV applications

What should I be aware of as a buyer? Beware of ‘Gen II’ claims!

This topic carries particular relevance, as not all ‘scientific CMOS’ cameras on the market offer a choice of Rolling and true Global exposure. Most offer one or the other. In fact, a sensor that is currently being widely positioned in the market as “Gen II”, is actually the sensor used in the Zyla 4.2 PLUS. However, we would not go so far as to describe this as a 2nd generation sensor, as it achieves a higher Quantum Efficiency at the notable expense of true Global shutter capability.

The customer is highly advised to make an informed choice before purchasing, since in microscopy the more photon-efficient Global shutter approach can actually result in a higher signal to noise, faster synchronized frame rates and non-distorted images.

For our work on quantifying red blood cell velocity in the retinal capillaries we elected to operate in Global shutter mode, which produces minimally distorted images. When operating in Rolling shutter mode we observed significant image warping, even for moderate eye movements.

Dr. Phillip Bedggood, Metha Laboratory, Department of Optometry and Vision Sciences, University of Melbourne, Australia
Performance and Innovations

Comprehensive trigger functionality

Neo and Zyla offer a selection of advanced trigger modes, designed to provide tight synchronization of the camera within a variety of experimental set-ups. Triggering is compatible with both Rolling and Global shutter modes.

- External TTL, Software and Internal trigger (including Simulated Global Exposure - Zyla 4.2 PLUS)
- ‘Time Lapse’ and ‘Continuous’ (overlapped) kinetic series
- Fast exposure switching (iCam)

sCMOS Software Solutions

Andor Solis
Solis is a ready to run Windows package with rich functionality for data acquisition and image analysis/processing.

Andor SDK3 and GPU Express
Andor SDK3 allows full control of sCMOS cameras from your own application, available as 32 and 64 bit libraries for Windows (7 and 8) and Linux. GPU Express integrates with SDK3 (Windows), created to simplify and optimize data transfers from camera to NVIDIA GPU card for real time processing of high bandwidth data sets.

Andor iQ
A comprehensive multi-dimensional imaging software package. Offers tight synchronization of camera with a comprehensive range of microscopy hardware, along with comprehensive rendering and analysis functionality.

Bitplane Imaris
Imaris delivers all the necessary functionality for visualization, segmentation and interpretation of multidimensional datasets, up to 100s of Gigabytes in size.

Third Party Software Compatibility

The range of third party software drivers for Andor’s sCMOS camera platforms is expanding steadily. Please enquire for further details.

The Andor Imaging Range

Have you found what you are looking for? As an alternative to the sCMOS cameras, Andor offers an extensive portfolio of high performance low light imaging camera technologies.

**iKon CCD**
- Deep cooled, low noise CCD
- -180°C cooling
- Back-illuminated > 90% QE
- 1 megapixel to 4 megapixel
- Enhanced NIR versions
- ‘PV Inspector’ model (Optimized for EL / PL in-line inspection)
- USB 2.0 true plug and play

**Clara Interline CCD**
- High-performance Interline CCD
- 50°C fan-cooled; -40°C vibration free mode
- 1.4 megapixel
- USB 2.0 true plug and play

**Zyla sCMOS**
- Fast, sensitive, compact, light sCMOS
- 1 electron read noise @ 30 fps
- 5.5 and 4.2 megapixel sensors / 6.5 μm
- 0°C cooling at +30°C ambient
- 100 fps sustained (10-tap Camera Link)
- Cost effective USB 3.0 option
- 16-bit data range

**Neo sCMOS**
- Vacuum cooled, lowest noise sCMOS
- 1 electron read noise @ 30 fps
- 5.5 megapixel / 6.5 μm
- -40°C vacuum cooling
- 30 fps sustained; 100 fps burst
- 4 GB on head memory
- Fan off vibration free mode

**iKon EMCCD**
- High performance EMCCD platform
- Single photon sensitive and back-illuminated
- Industry fastest frame rates
- -100°C cooling
- Flexible yet intuitive
- Quantify in electrons or photons

We tested the Andor sCMOS camera in conjunction with a popular cooled CCD camera, and compared with results from a similar test of a competitor’s scientific CMOS camera. Andor’s camera showed lowest dark noise, biggest field of view with very good sampling resolution (number of pixels), fastest frame rate, compatible signal to noise ratio and potentially largest dynamic range of detection. It is the most suitable camera on the market for our project.

Application & Technical Notes

New technology and innovation heralds a lot of new questions!

The Andor Learning Center is dedicated to providing a greater depth of understanding of the performance and innovations associated with the Andor scientific CMOS camera platform. Deeper insight is provided into areas such as the unique dual amplifier architecture (for extended dynamic range), sCMOS read noise distribution, dark noise effects, vacuum sensor protection and Rolling vs. Global shutter readout modes.

Visit the Learning Center now to discover more at andor.com/learning.

Key sCMOS Resources include:
• Rolling and Global Shutter
• Dual Amplifier Dynamic Range
• The Importance of TE Cooling to sCMOS Technology
• Comparing sCMOS With Other Scientific Detectors
• Andor sCMOS PC Recommendations and Data Flow Considerations
• Understanding Read Noise in sCMOS
• Interpolative Blemish Corrections on sCMOS NEW
• PIV Mode for Neo and Zyla NEW

We developed a quantitative phase scanner, capable of imaging an entire microscope slide in less than 50 minutes, with submicron resolution. Due to the high sensitivity of Andor sCMOS cameras we were able to reduce our exposure time from 100 ms to 15 ms. The fast frame rates and large field of view of Zyla 5.5 are instrumental in studying fast dynamics in cells and reducing the number of frames to be acquired.

Prof. Gabriel Popescu, Beckman Institute for Advanced Science and Technology, University of Illinois, USA

Customer Support

Andor products are regularly used in critical applications and we can provide a variety of customer support services to maximize the return on your investment and ensure that your product continues to operate at its optimum performance.

Andor has customer support teams located across North America, Asia and Europe, allowing us to provide local technical assistance and advice. Requests for support can be made at any time by contacting our technical support team at andor.com/support.

Andor offers a variety of support under the following format:

- On-site product specialists can assist you with the installation and commissioning of your chosen product
- Training services can be provided on-site or remotely via the Internet
- A testing service to confirm the integrity and optimize the performance of existing equipment in the field is also available on request.

A range of extended warranty packages are available for Andor products giving you the flexibility to choose one appropriate for your needs. These warranties allow you to obtain additional levels of service and include both on-site and remote support options, and may be purchased on a multi-year basis allowing users to fix their support costs over the operating life cycle of the products.
