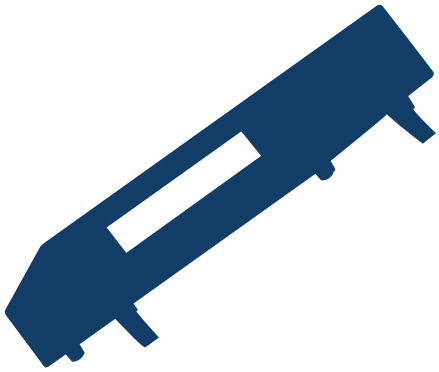
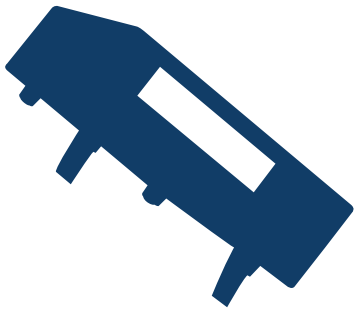
Instrument selection guide





How to select a temperature instrument for your application

Lake Shore offers the most comprehensive line of cryogenic temperature instruments in the world. The instruments described in this section are designed and manufactured for both general and specific temperature research applications in mind. For much of its 35-year history, Lake Shore has focused on instrumentation used for the precise measurement of temperatures from near absolute zero to well above room temperature.

Unfortunately, you can't have it all in one instrument. The most precise and accurate temperature instruments optimized for operation below 100 mK work with fewer sensors and provide lower heater power. The stable and high-resolution instruments designed for general cryogenic use work well for nearly any application, but can have limitations in rare circumstances. Choosing the appropriate instrument for a particular application necessitates prioritizing the requirements for that application.

Any one or several of the following factors may be important to you in selecting an instrument, whether temperature control or temperature monitoring is required:

- Operating temperature range
- Number of sensor inputs
- Sensor type compatibility
- Sensor input resistance and voltage ranges
- Current excitation ranges and methods
- High measurement resolution
- High electronic accuracy
- Control stability
- Number of reading displays
- Interfaces

  Ethernet
  USB
  IEEE-488
  RS-232C
  Alarms
  Relays
  Analog outputs
  Digital I/O
  Data logging

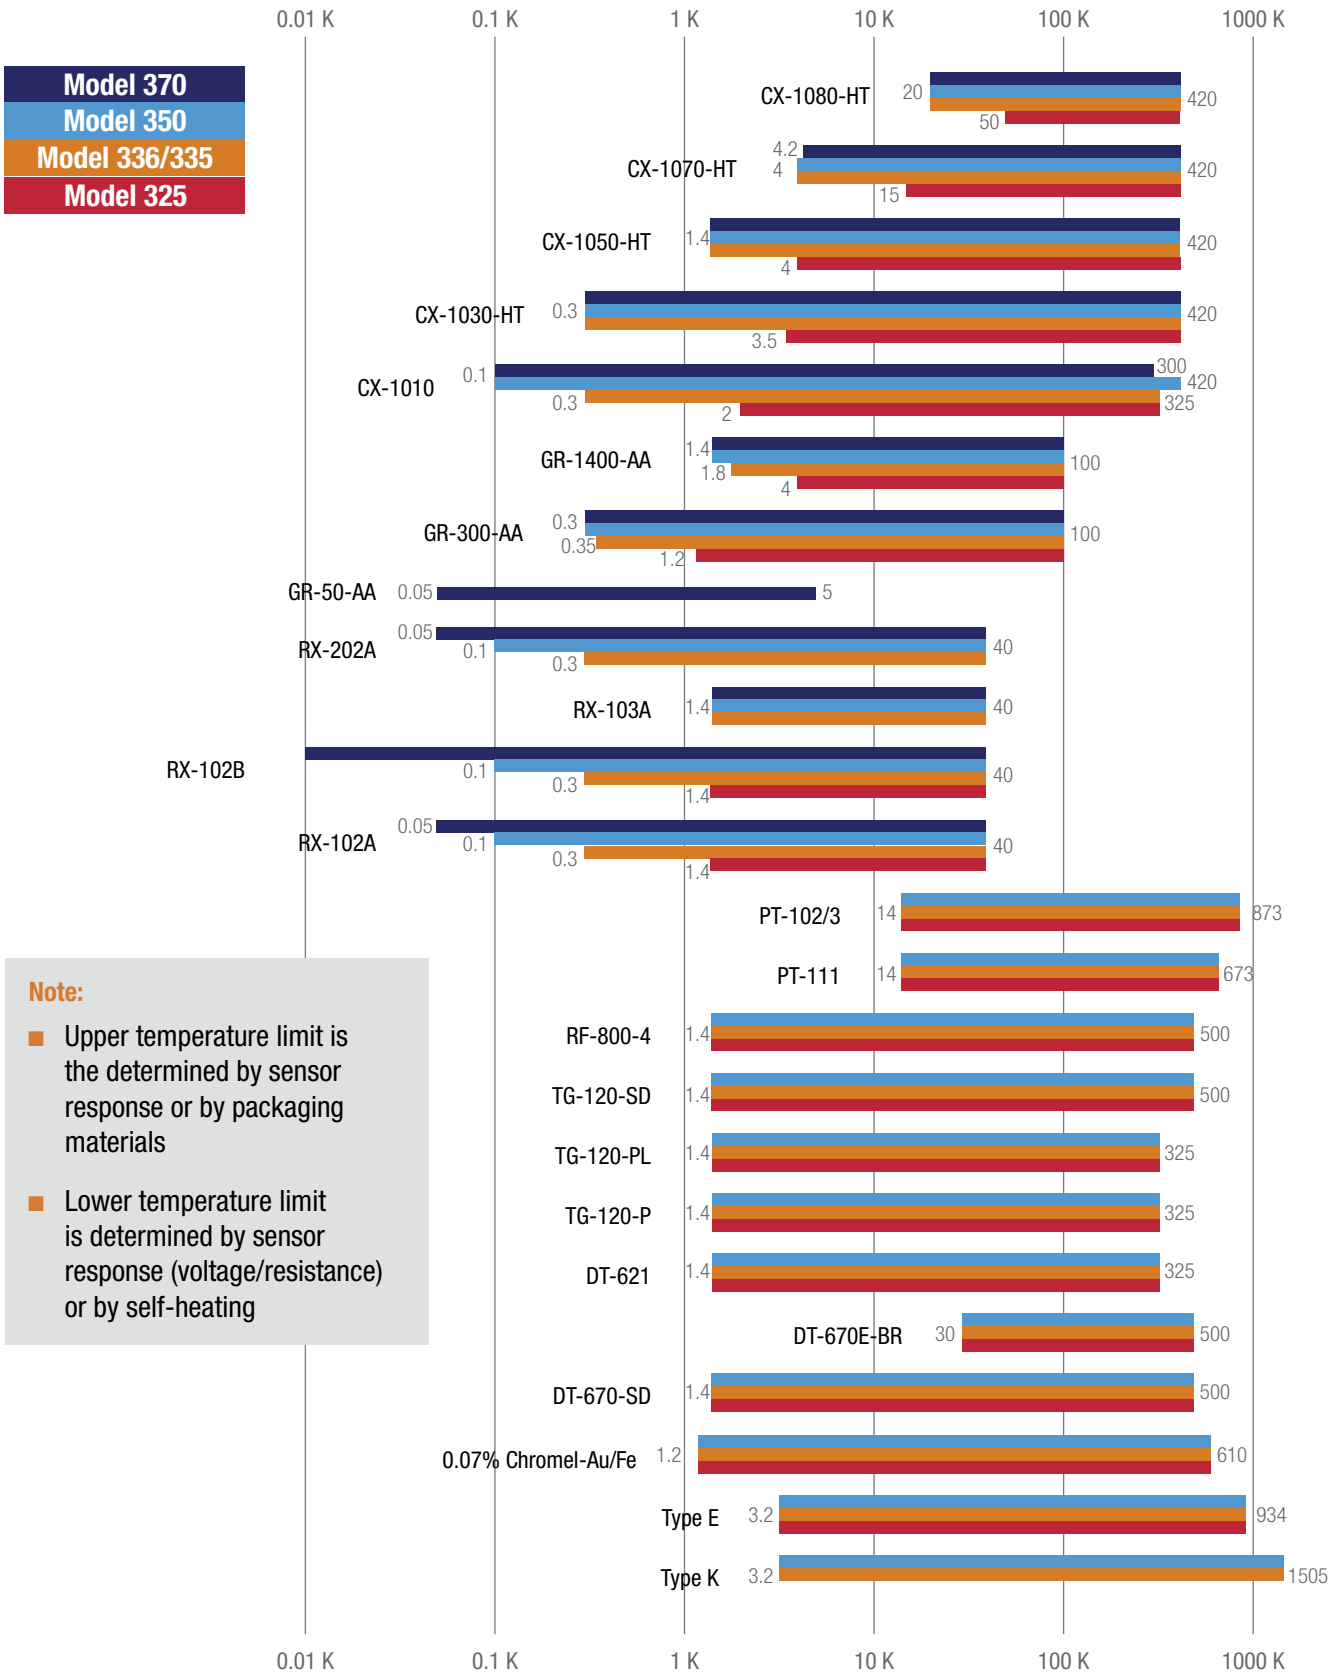
- Number of control loops, control type, and operating parameters
- Heater power and ranges
- Low cost

The tables on the following pages are designed to compare the instruments more easily with regard to sensor compatibility, operating temperature range, control capability, display features, and interface flexibility.

Our experienced sales staff is here to answer your questions. If you already know what your needs are, please inform us. Otherwise we ask a lot of questions to inform, educate, and to assist you in selecting the correct instrument.

Instrument selection guide

Temperature controller temperature ranges



Note:

- Upper temperature limit is the determined by sensor response or by packaging materials
- Lower temperature limit is determined by sensor response (voltage/resistance) or by self-heating
